The UN E-Government Survey 2008: From E-Government to Connected Governance assesses the e-government readiness of the 192 Member States of the UN according to a quantitative composite index of e-readiness based on website assessment, telecommunication infrastructure, and human resource endowment. ICTs can help reinvent government in such a way that existing institutional arrangements can be restructured and new innovative arrangements can flourish, paving the way for a transformed government. The focus of the report this year, in Part 2, is e-government initiatives directed at improving operational efficiency through the integration of back-office functions. Whilst such initiatives, if successful, will deliver benefits to citizens, the primary purpose is to improve the effectiveness of government and governmental agencies. Models of back-office integration, irrespective of the delivery mode, fall into three broad categories: single function integration, cross functional integration, and back-office to front-office integration. The level of complexity, expressed in terms of the number of functions within the scope and number of organizations involved, is the primary factor influencing a successful outcome - with a tendency amongst the more ambitious projects to fail to deliver the full anticipated benefits. The key variables involved in the delivery of back-office integration are the people, processes and technology required. Whilst the technology is increasingly resilient and 'fit for purpose', the evidence indicates that success or failure is less a technological issue and more a people issue - in particular, the ability to change public service cultures and motivate public sectorworkers to new ways of working, address trade union concerns, and provide adequately skilled and competent management

This book charts the convergence of science, culture, and politics across Portugal's empire, showing how a global geographical concept was born. In accessible, narrative prose, this book explores the unexpected forms that science took in the early modern world. It highlights little-known linkages between Asia and the Atlantic world.

Violence is an all-too-real part of life for children around the globe - regardless of their economic circumstances and sociocultural background - with both immediate and long-term consequences. Available data indicate that children's experience of violence is widespread, taking different forms: About half the world's children are subjected to corporal punishment at home; roughly 3 in 4 children between the ages of 2 and 4 years receive violent discipline by parents and other primary caregivers; half of students aged 13 to 15 experience peer violence in and around school; and 1 in 3 adolescent girls aged 15 to 19 have been victims of intimate partner violence. As daily lives and communities are upended by COVID-19, concern is mounting that violence against children may increase. Children with a history of abuse may find themselves even more vulnerable, both at home and online, and may experience more frequent and severe acts of violence. Others may be victimized for the first time. Children's exposure to increased protection risks as a result of the coronavirus crisis may occur through a number of pathways. The pandemic could result in loss of parental care due to death, illness or separation, thereby placing children at heightened risk for violence, neglect and exploitation.

Scientists and engineers use computer simulations to study relationships between a model's input parameters and its outputs. However, thorough parameter studies are challenging, if not impossible, when the simulation is expensive and the model has several inputs. To enable studies in these instances, the engineer may attempt to reduce the dimension of the model's input parameter space. Active subspaces are an emerging set of dimension reduction tools that identify important directions in the parameter space. This book describes techniques for discovering a model's active subspace and proposes methods for exploiting the reduced dimension to enable otherwise infeasible parameter studies. Readers will find new ideas for dimension reduction, easy-to-implement algorithms, and several examples of active subspaces in action.

This volume offers innovative insights into and approaches to the multiple historical intersections between distinct modalities of internationalism and imperialism during the twentieth century, across a range of contexts. Bringing together scholars from diverse theoretical, methodological and geographical backgrounds, the book explores an array of fundamental actors, institutions and processes that have decisively shaped contemporary history and the present. Among other crucial topics, it considers the expansion in the number and scope of activities of international organizations and its impact on formal and informal imperial politics, as well as the propagation of developmentalist ethos and discourses, relating them to major historical processes such as the growing institutionalization of international scrutiny in the interwar years or, later, the emerging global Cold War.
