In the same limit this equation has solutions  $k_a = \pi + \delta$ , where  $\delta \ll \pi$ . We expand to obtain  $(\cos(\pi + \delta) - \cos(\delta)) / (2 \sin(\delta/2)) = -1 + \delta^2 / 2 + \dots = -1 + \delta^2 / 2$ , which has the solution  $\delta = 0$  and  $\delta = 2\pi n$ . The energy gap is  $E_g = \hbar^2 k^2 / 2m = \hbar^2 (\pi/a)^2 / 2m = \hbar^2 \pi^2 / 2ma^2 = 4P \cdot J / \pi = \pi \hbar^2 v_F^2 / 4$ . Quantum engineering – the design and fabrication of quantum coherent structures – has emerged as a field in physics with important potential applications. This book provides a self-contained presentation of the theoretical methods and experimental results in quantum engineering. The book covers topics such as the quantum theory of electric circuits, theoretical methods of quantum optics in application to solid state circuits, the quantum theory of noise, decoherence and measurements, Landsauer formalism for quantum transport, the physics of weak superconductivity and the physics of two-dimensional electron gas in semiconductor heterostructures. The theory is complemented by up-to-date experimental data to help put it into context. Aimed at graduate students in physics, the book will enable readers to start their own research and apply the theoretical methods and results to their current experimental situation.

College physics course for students majoring in science and engineering.

This textbook introduces the molecular and quantum chemistry needed to understand the physical properties of molecules and their chemical bonds. It follows the authors' earlier textbook "The Physics of Atoms and Quanta" and presents both experimental and theoretical fundamentals for students in physics and physical and theoretical chemistry. The new edition treats new developments in areas such as high-resolution two-photon spectroscopy, ultrashort pulse spectroscopy, photoelectron spectroscopy, optical investigation of single molecules in condensed phase, electroluminescence, and light-emitting diodes.

Statistical thermodynamics plays a vital linking role between quantum theory and chemical thermodynamics, yet students often find the subject unpalatable. In this updated version of a popular text, the authors overcome this by emphasising the concepts involved, in particular demystifying the partition function. They do not get bogged down in the mathematical niceties that are essential for a profound study of the subject but which can confuse the beginner. Strong emphasis is placed on the physical basis of statistical thermodynamics and the relations with experiment. After a clear exposition of the distribution laws, partition functions, heat capacities, chemical equilibria and kinetics, the subject is further illuminated by a discussion of low-temperature phenomena and spectroscopy. The coverage is brought right up to date with a chapter on computer simulation and a final section which ranges beyond the narrow limits usually associated with student texts to emphasise the common dependence of macroscopic behaviour on the properties of constituent atoms and molecules. Since first published in 1974 as "Entropy and Energy Levels", the book has been very popular with students. This revised and updated version will no doubt serve the same needs.

From optical fundamentals to advanced applications, this comprehensive guide to micro-optics covers all the key areas for those who need an in-depth introduction to micro-optic devices, technologies, and applications. Topics covered range from basic optics, optical materials, refraction, and diffraction, to micro-mirrors, micro-lenses, diffractive optics, optoelectronics, and fabrication. Advanced topics, such as tunable and nano-optics, are also discussed. Real-world case studies and numerous worked examples are provided throughout, making complex concepts easier to follow, whilst an extensive bibliography provides a valuable resource for further study. With exercises provided at the end of each chapter to aid and test understanding, this is an ideal textbook for graduate and advanced undergraduate students taking courses in optics, photonics, micro-optics, microsystems, and MEMs. It is also a useful self-study guide for research engineers working on optics development.

Since the publication of Eliza May Butler's Tyranny of Greece over Germany in 1935, the obsession of the German educated elite with the ancient Greeks has become an accepted, if severely underanalyzed, cliché. In Down from Olympus, Suzanne Marchand attempts to come to grips with German Graecophilia, not as a private passion but as an institutionally generated and preserved cultural trope. The book argues that nineteenth-century philhellenes inherited both an elitist, normative aesthetics and an ascetic, scholarly ethos from their Romantic predecessors; German "neohumanists" promised to reconcile these intellectual commitments, and by so doing, to revitalize education and the arts. Focusing on the history of classical archaeology, Marchand shows how the injunction to imitate Greek art was made the basis for new, state-funded cultural institutions. Tracing interactions between scholars and policymakers that made possible grand-scale cultural feats like the acquisition of the Pergamum Altar, she underscores both the gains in specialized knowledge and the failures in social responsibility that were the distinctive products of German neohumanism. This book discusses intellectual and institutional aspects of archaeology and philhellenism, giving extensive treatment to the history of prehistorical archaeology and German "orientalism." Marchand traces the history of the study, excavation, and exhibition of Greek art as a means to confront the social, cultural, and political consequences of the specialization of scholarship in the last two centuries.
