Female Reproductive System Study Guide

View of the male reproductive system. During erection, parasympathetic neurons stimulate dilation of the arteries that deliver blood to the corpus cavernosa and spongiosum. As a result, blood collects in these blood vessels and causes the penis to begin to become erect. The developing erection also constricts the exiting veins of the penis.

The Male Reproductive System - CliffsNotes Study Guides

The reproductive system is the human organ system responsible for the production and fertilization of gametes and, in females, the carrying of a fetus. Both male and female reproductive systems have organs called gonads (testes in males, ovaries in females) that produce gametes (sperm or eggs) and sex hormones (such as testosterone in males and estrogen in females).

Anatomy of the Urinary System

The urinary system consists of two kidneys, two ureters, a urinary bladder , and a urethra. The kidneys alone perform the functions just described and manufacture urine in the process, while the other organs of the urinary system provide temporary storage reservoirs for urine or serve as transportation channels to carry it from one body region to another.

Physiology 42702 Lecture Outline:
Reproductive System - The thecal
and granulosa cells, together
called the follicular cells, secrete
estrogen - The rupture of the
follicle at ovulation signals the
end of the follicular phase and
begins the luteal phase - The
collapsed antrum fills with blood
clot and transforms into the
corpus luteum ("body yellow") to
secrete progesterone with a little
estrogen - If
fertilization/implantation occur
then the corpus luteum continues
past 14 days to ...

Answers

The female reproductive system develops before birth but doesn't reach maturity until puberty. From puberty until around midlife, females will have a monthly menstrual cycle that will allow the female to have a child when an egg cell is fertilized by a sperm cell. When a woman reaches midlife, she undergoes.
